Technology/molecule development through spin-off creation: a valuable step for research results valorization

ABSTRACT

Entrepreneurial activity is described as one of the many ways that can be used by scientist to bring their discoveries into effective therapies and to see their research results as contributing to society.

This seminar aims to introduce to Researchers the benefits and issues associated to the different steps of spin-off creation. Through the testimonial of a Researcher-entrepreneur, Dr Pierre Belichard, the essential questions, the various interlocutors and the different founding stages associated to this Research valorization activity will be described.

Pierre Belichard is founder and Chief Executive Officer of Enterome, a pharma company created in 2012 which dedicates its activities to the development of innovative therapeutic approaches (drugs and biomarkers) to support a personalized medicine for microbiome-related diseases. Enterome is also leading the development of new industry standards in gut microbiome quantitative and functional analysis.
